## READING COMPREHENSION SECTION

1

Read the text. Then write the missing number.

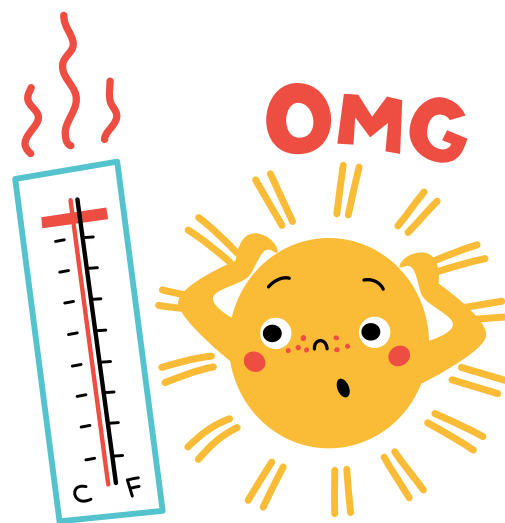

### Living with wildfires as heat waves increase

Parts of southern and southeast Australia experience some of the worst wildfires in the world. The number of wildfires increases when the country has longer-than-average heat waves. During a heat wave, temperatures regularly go above 45°C. Dry weather and strong winds of up to 120 km/h cause the wildfires to move very quickly. According to scientists, climate change will increase the number of heat waves every year.

During a season of wildfires, there can be as many as 80 wildfires burning at the same time across the area. At these times, there can be up to 2,000 firefighters working together to fight the fires, as the fires burn large amounts of land.

Four out of five wildfires start because of human activity, and then hot winds cause the fire to move quickly. In many cases, by the time a person sees a wildfire, there might not be enough time to escape. Wildfires can travel up to 20 km/h in dry weather. They can burn everything in their path in just a few minutes. If there is a strong threat of wildfires, the Australian government will ask people in the area to leave their houses.

People who live in dangerous areas know that they might lose their homes at any time during the wildfire season. Most families in these areas have an emergency pack at the front door of their house. The pack contains the things they need, including water, food, some money, and important family papers. People know that when they hear about a wildfire in their area, they are going to need to escape very quickly.
